It started in the beginning of 2014 I think.
Every time when print the payment details of an bought ebay article with firefox,
the printed characters are distorted and nearly unreadable.

It makes no difference in choose of the printer or printer driver.
Even printing to a file (pdf or ps) brings the same.
I have this on two Gentoo computers with a lot versions of cups and firefox.
I had this with firefox nightly builds too.

Doing the same with debian or ubuntu works fine.
